

## The Roundabout on the Virginia Tech campus in Blacksburg, VA

Statistics show that the modern roundabout is the safest at-grade intersection.

Now consider this:

In 2004, the Institute of Transportation Engineers estimated that if only 10 percent of the estimated 265,000 intersections with signals in the United States were converted to roundabouts, **annual vehicle delays would decrease by eight million hours and fuel consumption would be reduced by more than five million gallons.**
